

Logistics Operations Platform

Built for small logistics operators in Lagos — and for anyone who wants to start a dispatch business from scratch.

01

The Problem

Small logistics operators in Lagos — guys running 2 to 10 bikes — manage everything in their head or on WhatsApp. They have no system. They have no visibility. They have no way to give their clients a tracking link.

Pain Point	Current Reality	Cost
Job assignment	WhatsApp messages, phone calls	Jobs get missed or duplicated
Rider tracking	None — call the rider and hope	Operators fly blind all day
Client updates	Manual calls when remembered	Clients lose trust, churn
Revenue tracking	Mental notes or paper	No idea which jobs made money
Starting fresh	No system, no playbook	High failure rate for new operators

02

The Solution

Fleeto is the operating system for small logistics businesses. It gives operators a simple dashboard to run their fleet, gives riders a mobile job list, and gives end customers a real-time tracking link — all without needing technical knowledge to set up or run.

Fleeto also serves a second type of user: the aspiring logistics entrepreneur who wants to start a dispatch business — fulfilling orders for e-commerce brands, marketplaces, or import businesses that need last-mile delivery across Nigeria. Fleeto gives them the infrastructure to launch without building from scratch.

The Operator	The Entrepreneur
Already running a small fleet. Has clients, has riders, has daily jobs. Needs a system to stop managing everything on WhatsApp.	Wants to start a logistics business. Needs to onboard riders, take jobs from brands and platforms, and look professional from day one.
2–10 riders · Daily delivery jobs · Lagos-based	0–5 riders to start · B2B fulfilment · Growth-focused

03

MVP Scope

The MVP focuses on three things that make an operator say *'I need this.'* Everything else is post-launch.

01	02	03
Job Assignment	Rider Tracking	Customer Notification
Create and assign delivery jobs to riders in seconds.	See where your riders are in real time on a live map.	Customer gets a WhatsApp link to track their package.

04

Feature Breakdown

Core MVP Features

Operator Dashboard

MVP

A clean web dashboard where the operator sees all active jobs, rider status, and delivery progress in one view. Create a job in under 30 seconds — pickup address, drop-off address, parcel description, assign to a rider. No training needed.

Rider Mobile App

MVP

A lightweight mobile-first interface for riders. Shows their assigned jobs in order, pickup and drop-off details, and lets them mark jobs as picked up, in transit, or delivered. Works on any Android phone. Minimal data usage.

Real-time Rider Location

MVP

Operator sees rider locations on a live map. No guessing, no calling. Location updates every 30 seconds using the rider's phone GPS. Visible only while a job is active.

WhatsApp Tracking Link

MVP

When a job is created, Fleeto automatically generates a tracking link and sends it to the end customer via WhatsApp. Customer sees a live map of the rider's current location and estimated arrival. No app download required for the customer.

Fleet & Rider Management

MVP

Operator adds riders to their fleet, assigns them a role, and manages their profile. Rider gets an invite link to download the app and join the fleet. Simple onboarding — no back-and-forth.

Business Onboarding (Entrepreneur Mode)

MVP

A dedicated onboarding flow for entrepreneurs starting a new logistics business. Guides them through fleet setup, pricing configuration, and connecting their first client or platform. Feels like a launchpad, not a blank dashboard.

Post-MVP — Out of Scope for v1

Revenue & Earnings Tracking	Per-job revenue, rider pay summaries, weekly earnings reports.
Invoice Generation	Auto-generate invoices for business clients at end of month.
Client Portal	Business clients get a read-only portal to create jobs and track their deliveries.
Multi-city Expansion	Support for operators running cross-city or inter-state logistics.
Ratings & Reviews	End customers rate riders after delivery.
Bulk Job Import	CSV upload for e-commerce brands sending 50+ deliveries at once.
Cold Chain / Perishables	Specialised job types for food and pharmaceutical delivery.

Core User Flows

01	Operator creates and assigns a job
1	Operator logs into dashboard
2	Taps 'New Job'
3	Enters pickup address, drop-off address, parcel description
4	Selects an available rider from their fleet
5	Enters customer phone number (optional — for WhatsApp notification)
6	Confirms — job is created and pushed to rider's app
7	Customer receives a WhatsApp tracking link automatically

02	Rider receives and completes a job
1	Rider opens the app — sees new job at top of list
2	Views pickup details and navigates to sender
3	Marks job as 'Picked up'
4	Navigates to drop-off address
5	Marks job as 'Delivered' — optionally takes a photo
6	Job status updates on operator dashboard in real time
7	Customer's tracking link shows 'Delivered'

03	Entrepreneur starts a new logistics business
1	Entrepreneur signs up and selects 'Start a logistics business'
2	Names their business and sets their service area
3	Adds first rider(s) via invite link
4	Configures delivery pricing (flat rate or per-zone)
5	Connects first client or business via a shareable job link
6	First job is created — fleet is live

06

Technical Architecture

Fleeto is built as a mobile-first web platform with a FastAPI backend. All rider-facing interfaces are optimised for low-end Android on limited data.

Layer	Technology	Rationale
-------	------------	-----------

Backend API	FastAPI (Python)	Fast, async, clean — perfect for real-time job and location updates
Database	PostgreSQL	Relational — jobs, riders, fleets, and clients have clear relationships
Real-time	WebSockets via FastAPI	Rider location pushes to operator dashboard without polling
Mapping	Google Maps / Mapbox	Location display, route drawing, address autocomplete
WhatsApp	WhatsApp Business API	Automated tracking link delivery to end customers
Auth	JWT + refresh tokens	Separate token flows for operators and riders
Rider App	React PWA (mobile web)	No app store — riders access via browser, works offline partially
Operator Dashboard	React web app	Full desktop and tablet support for operators managing their fleet
Hosting	Railway / Render	Simple deployment, low ops overhead for solo dev

07

Monetisation

Fleeto charges a monthly subscription per operator — flat fee, no per-job commissions. Simple for the operator to understand, predictable revenue for Fleeto.

Plan	Price / month	Fleet size	Includes
Starter	Free	Up to 2 riders	Job assignment, basic tracking, WhatsApp notifications
Growth	N5,000	Up to 10 riders	Everything in Starter + live map, job history, client links
Business	N15,000	Unlimited	Everything in Growth + analytics, bulk jobs, priority support

The Starter tier is free intentionally — removes all friction for the first operator to try Fleeto. Upgrade happens naturally when they add a third rider or need the map.

08

Go-to-Market

Start in one neighbourhood. Get it working well for five operators. Let word of mouth do the first expansion.

Week 1–2	Find 3 small logistics operators in Lagos willing to try a free tool. Ikeja, Yaba, or Surulere are good starting zones.
Week 3–4	Onboard them manually. Sit with them. Watch where they struggle. Fix the product in real time.
Month 2	First paying customer. Even one operator on the Growth plan at N5,000 validates the model.
Month 3	Five paying operators. Begin targeting entrepreneurs wanting to start dispatch businesses — different acquisition channel, same product.
Month 4+	Target e-commerce brands (Instagram vendors, Temu fulfilment, Jumia last-mile) who need an operator to plug into their logistics.

09

UI/UX Design Prompt

Use this prompt verbatim with Stitch to generate the UI/UX for Fleeto.

Design a complete UI/UX for a mobile and web logistics operations platform called Fleeto. The product serves two types of users: (1) small logistics operators in Lagos who run fleets of 2–10 dispatch riders, and (2) entrepreneurs who want to start a logistics business from scratch. The core experience has three surfaces:

SURFACE 1 — OPERATOR DASHBOARD (web, desktop-first, also works on tablet) This is the control centre. The operator sees all active jobs, rider locations on a live map, and fleet status in one view. Key screens: (a) Dashboard home — live job list + map split view, riders shown as dots with status indicators. (b) New job form — pickup address, drop-off address, parcel description, assign rider, customer phone number. Clean, fast — completable in under 30 seconds. (c) Fleet management — list of riders, their status (active/idle/offline), invite new rider. (d) Job detail — full timeline of a single job from created to delivered. (e) Onboarding for entrepreneurs — a guided setup flow: name your business, set service area, add first rider, configure pricing, connect first client.

SURFACE 2 — RIDER APP (mobile-first, PWA, optimised for low-end Android) Extremely simple. Riders see their job list in order. Each job card shows pickup address, drop-off address, and parcel description. Status actions: Mark as Picked Up, Mark as Delivered. No unnecessary complexity. Works on limited data. Key screens: (a) Job list — active job at top, queued jobs below. (b) Job detail — full address, map, status action button. (c) Delivery confirmation — mark delivered, optional photo upload.

SURFACE 3 — CUSTOMER TRACKING PAGE (mobile web, no login required) A single clean page the customer opens from their WhatsApp link. Shows: rider's current location on a map, estimated arrival, parcel status (In transit / Arriving / Delivered). No account needed. Should feel reassuring and trustworthy.

DESIGN SYSTEM: Clean, modern, minimal. Inspired by the polish of Uber, Linear, and Vercel. Neutral palette — near-black primary, zinc/grey surfaces, amber accent for active/alert states, green for confirmed/delivered states. Strong typographic hierarchy. Rounded surfaces (border-radius 12–20px). Soft shadows, generous spacing. Mobile-first for rider and customer surfaces. No heavy gradients, no loud illustrations. The product should feel professional and trustworthy — this is infrastructure for people's livelihoods. **TONE:** Calm, competent, efficient. Not playful. Not corporate. Think: a tool built by someone who actually understands logistics in Lagos. **IMPORTANT CONSTRAINTS:** - Rider app must work on small screens (360px width minimum) with large touch targets - All primary actions must be reachable with one thumb - Status colours must be clear without relying on colour alone (use icons + text) - Forms must feel fast — minimal fields, smart defaults, clear validation - The operator dashboard map should be the hero element on the home screen - Customer tracking page should load fast and work without JavaScript for the static parts
